

Source: frozen groundwater lag tables (NWDP six-hourly depth-to-water telemetry, station-anomaly composited).

Protocol expectation is a NEGATIVE association (deeper groundwater $\rightarrow$ more negative LOS). Forward lags test the causal direction; reverse lags are falsification tests. 0 of 16 forward-lag tests survive Benjamini-Hochberg FDR $q = 0.05$ (all permutation $p \geq 0.49$).

H005 has no groundwater composite and is absent. This is not a refutation of groundwater as a mechanism: aquifer metadata, well depths and screened intervals are unavailable, and LOS is not vertical displacement.
